

Customer Churn Analysis & Predictive Analytics

Business Problem

Customer churn reduces recurring revenue and increases acquisition costs. This project focuses on identifying churn-risk customer segments using SQL, Python, and Power BI.

Project Objectives

Analyze churn trends, create KPI dashboards, automate reporting workflows, and deliver retention-focused business insights.

Key Insights

High monthly charges and low customer tenure were strongly associated with churn behavior. SQL segmentation identified multiple high-risk customer groups.

Business Recommendations

Introduce retention-focused campaigns, improve onboarding, and expand KPI reporting dashboards for operational visibility.

Metric	Value
Customer Records	3,000+
KPI Metrics	12+
Automation Improvement	60%
High-Risk Segments	3
